

DESD – Embedded Operating System

1. What is OS? What are its important functions?
2. What is system call? How it is executed?
3. Explain terms: Multi-programming, Multi-tasking, Multi-threading, Multi-processing and Multi-user?
4. Explain Linux kernel design (monolithic or modular).
5. Explain process life cycle.
6. What are Linux IPC mechanisms? Explain any three with diagram.
7. What is difference between process and thread? How can you create them in Linux program?
8. What is difference between semaphore and mutex? How can you create them in Linux program?
9. What is file? Which system calls are used to manipulate files in Linux? Write their prototypes and explain.
10. What is paging? What is page fault and how it is handled?
11. What is difference between starvation and deadlock?
12. How vfork() system call works? What is copy-on-write?
13. Explain OS booting. Explain Linux booting.
14. How many Linux run-levels are there? Which features are enabled in each runlevel?
15. Explain regex commands and wildcard characters.
16. Which Linux command is used to kill all running instances of the same program.
17. How security is implemented in Linux file systems? Tell commands related to it.
18. How redirection and pipe in Linux commands work?
